Skills

- Docker | Kubernetes | Git | Jenkins | Red Hat OpenShift | Terraform | Vault | Prometheus
- Cloud Computing | Monitoring | DevOps Fundamentals | Containerization | Scripting
- Agentic AI | Prompt Engineering | Python | Shell Script | HTML | CSS | JavaScript | Node.js

Experience

Delivery Consultant	IBM	Feb 2024 - Present
• Contributed to production upgrades of OpenShift (OCP), OpenShift Data Foundation (ODF), and IBM Cloud Pak for Integration (CP4I) clusters in enterprise environments. • Automated OpenShift cluster health checks and reporting, improving visibility and reducing manual operational effort. • Designed and developed an internal Health Check Portal for centralized monitoring and dynamic report generation. • Troubleshoot networking, storage, and cluster configuration issues in multi-node OpenShift environments.		

Education

Sri Venkateswara Engineering College Tirupati, AP Computer Science Engineering Bachelor of Technology - 8.01	July 2020 - May 2024
Narayana Junior College Guntur, AP Higher Secondary Board - 8.11	June 2018 - June 2020
Bhashyam Public School Kadapa, AP Secondary Board of Education - 9.5	June 2017- Mar 2018

Certifications & Badges

DevOps & Systems

- AWS Cloud Practitioner
- Vault Associate 003
- Terraform Associate 004
- Red Hat System Administration I
- Docker Essentials & Docker Swarm (Hands-on)
- TCS NQT-IT Registration Number: 22071452837

Artificial Intelligence & Emerging Tech

- 5-Day AI Agents Intensive Course – Kaggle (Google)
- IBM Watsonx Essentials
- Generative AI Foundations
- Intro to Quantum-Safe Cryptography
- Basics of Quantum Information

Programming & Data

- Data Analysis using Python

Projects & Contributions

❖ Automated OpenShift Health Check Portal – Internal Asset

Designed and developed an automated health check portal to streamline OpenShift cluster monitoring and generate comprehensive system health reports.

Built a responsive frontend using HTML, CSS, JavaScript, and Bootstrap, and implemented backend services with Node.js to enable seamless report generation and workflow automation.

Integrated DB2 for secure user authentication, structured data storage, and dynamic report retrieval.

❖ OpenShift Cluster Management

Configured, validated, and troubleshoot OpenShift clusters across multiple environments (Dev, Non-Prod, Prod), ensuring platform stability and high availability.

Supported deployment workflows and cluster maintenance activities to maintain operational reliability.

Performed health assessments and provided remediation recommendations to optimize cluster performance.

❖ CP4I Cluster Upgrades

Executed CP4I cluster upgrades across environments, conducting detailed pre-upgrade readiness checks and post-upgrade validations.

Diagnosed and resolved upgrade-related issues to ensure minimal downtime and seamless environment transitions.

Verified service integrity and application functionality following upgrade activities.

❖ Pilot Validation & Enterprise Support Activities

Conducted pilot environment validations and contributed to implementation checks to ensure readiness for production rollouts.

Collaborated with senior engineers to analyze workflows, identify potential risks, and support automation improvements.

❖ AI Assisted Workflow Exploration

Leveraged **IBM Bob** (AI coding assistant) to explore enterprise automation workflows using the MCP.

Connected MCP to a virtual machine and initiated a Java application modernization workflow targeting a WebSphere to Liberty re-platforming upgrade.

Gained hands-on experience with AI-driven tool orchestration, context handling, and applying agentic workflows to real infrastructure environments.

❖ Predictive Analytics for Crop Prediction and Assortment Planning using Machine Learning

➤ Final Year Project

Developed a machine learning model to predict optimal crops based on soil pH, annual rainfall, temperature, and humidity.

Integrated real-time weather data using an external API to correlate current and historical climate conditions for improved crop prediction accuracy.

Trained and evaluated classification models to recommend high-yield crop options for specific geographic regions.

Implemented data preprocessing, feature engineering, and model validation to enhance prediction reliability.
